May 2008

## I. Introduction

This document describes the air quality modeling performed by EPA in support of the final rule to control emissions from new nonroad Spark-Ignition (SI) engines. A national scale air quality modeling analysis was performed to estimate the effect of the rule on future 8-hour ozone concentrations, future annual fine particulate matter $\left(\mathrm{PM}_{2.5}\right)$ concentrations, and future visibility levels. The inclusion of $\mathrm{PM}_{2.5}$ and visibility impacts represents an improvement on the modeling that was done for the proposed notice of rulemaking ${ }^{1}$ which only considered the impacts on ozone ${ }^{2}$.

An additional change from the modeling done at proposal was our use of the Community Multiscale Air Quality (CMAQ) model ${ }^{3}$. The CMAQ model simulates the multiple physical and chemical processes involved in the formation, transport, and destruction of fine particulate matter and ozone. The 2002 version of the CMAQ modeling platform was used. A modeling platform is a structured system of connected modeling-related tools and data that provide a consistent and transparent basis for assessing the air quality response to changes in emissions and/or meteorology. A platform typically consists of a specific air quality model, base year and future year baseline emissions estimates, and a set of meteorological model inputs. The final Locomotive/Marine rule modeling analyses ${ }^{4}$ were also based on the 2002 CMAQ modeling platform.

## II. CMAQ Model Version, Inputs and Configuration

## A. Model version

CMAQ is a non-proprietary computer model that simulates the formation and fate of photochemical oxidants, including $\mathrm{PM}_{2.5}$ and ozone, for given input sets of meteorological conditions and emissions. This analysis employed a version of CMAQ based on the latest publicly-released version of CMAQ available at the time of the final SI engine rule modeling (i.e., version 4.6$)^{5}$. CMAQ version 4.6 reflects recent updates intended to improve the underlying science from version 4.5. These model enhancements include:

[^0]1) an updated Carbon Bond chemical mechanism (CB-05) and associated Euler Backward Iterative (EBI) solver was added;
2) an updated version of the ISORROPIA aerosol thermodynamics module was added;
3) the heterogeneous $\mathrm{N}_{2} \mathrm{O}_{5}$ reaction probability is temperature- and humidity-dependent;
4) the gas-phase reactions involving $\mathrm{N}_{2} \mathrm{O}_{5}$ and $\mathrm{H}_{2} \mathrm{O}$ are now included; and
5) an updated version of the vertical diffusion module was added (ACM2).

Additionally, there were a few minor changes made to the release version of CMAQ v4.6 by the EPA model developers subsequent to its release. The relatively minor changes and new features of this internal version that was ultimately used in this analysis (version 4.6.1i) are described in a memorandum from EPA's Office of Research and Development. ${ }^{6}$

## B. Model domain and grid resolution

The CMAQ modeling analyses were performed for a domain covering the continental United States, as shown in Figure II-1. This domain has a parent horizontal grid of 36 km with two finer-scale 12 km grids over portions of the eastern and western U.S. The model extends vertically from the surface to 100 millibars using a sigma-pressure coordinate system. Air quality conditions at the outer boundary of the 36 km domain were taken from a global model and did not change over the simulations. In turn, the 36 km grid was only used to establish the incoming air quality concentrations along the boundaries of the 12 km grids. All of the modeling results assessing the emissions reductions from the small SI engine rule were taken from the 12 km grids. Table II-1 provides some basic geographic information regarding the CMAQ domains.

Table II-1. Geographic elements of domains used in the small SI engine rule modeling.

|  | CMAQ Modeling Configuration |  |  |
| :---: | :---: | :---: | :---: |
|  | National Grid | Western U.S. Fine Grid | Eastern U.S. Fine Grid |
| Map Projection | Lambert Conformal Projection |  |  |
| Grid Resolution | 36 km | 12 km | 12 km |
| Coordinate Center | $97 \operatorname{deg} \mathrm{~W}, 40 \operatorname{deg} \mathrm{~N}$ |  |  |
| True Latitudes | $33 \operatorname{deg} \mathrm{~N}$ and 45 deg N |  |  |
| Dimensions | $148 \times 112 \times 14$ | $213 \times 192 \times 14$ | $279 \times 240 \times 14$ |
| Vertical extent | 14 Layers: Surface to 100 millibar level (see Table II-2) |  |  |

[^1]Figure II-1. Map of the CMAQ modeling domain. The black outer box denotes the $36 \mathbf{k m}$ national modeling domain; the red inner box is the 12 km western U.S. fine grid; and the blue inner box is the $\mathbf{1 2} \mathbf{~ k m}$ eastern U.S. fine grid.

## C. Modeling Period / Ozone Episodes

The 36 km and both 12 km CMAQ modeling domains were modeled for the entire year of $2002 .{ }^{7}$ All 365 model days were used in the calculations of the impacts of the small SI engine controls on annual average levels of $\mathrm{PM}_{2.5}$. For the 8 -hour ozone results, we only used the modeling results from the period between May 1 and September 30, 2002. This 153-day period generally conforms to the ozone season across most parts of the U.S. and contains the majority of days with observed high ozone concentrations in 2002.

## D. Model Inputs: Emissions, Meteorology and Boundary Conditions

1. Base Year and Future Baseline Emissions: As noted in the introduction section, a 2002-based CMAQ platform was used for the final rule modeling. The 2002-based platform

[^2]builds upon the general concepts, tools and emissions modeling data from the 2001-based Comprehensive Air Quality Model with Extensions (CAMx) platform used at proposal, while updating and enhancing many of the emission inputs and tools. A summary of the emissions inventory development is described below. More detailed documentation on the methods and data summaries of the 2002-based platform emissions for base and future years is also available separately. ${ }^{8}$

We used version 3 of the 2002-based platform which takes emission inventories from the 2002 National Emissions Inventory (NEI) version 3.0. These inventories, with the exception of California, include monthly onroad and nonroad emissions generated from the National Mobile Inventory Model (NMIM) using versions of MOBILE6.0 and NONROAD2005 consistent with recent national rule analyses. ${ }^{9,10,11}$ The locomotive and marine inventories are based on national level estimates developed for the recent locomotive and marine rule making. ${ }^{12}$ The 2002-based platform and its associated chemical mechanism (CB05) employs updated speciation profiles using data included in the SPECIATE4.0 database. ${ }^{13}$ In addition, the 2002-based platform incorporates several temporal profile updates for both mobile and stationary sources.

The 2002-based platform includes emissions for a 2002 base year model evaluation case, a 2002 base case and several projection years. The projection years include 2020 and 2030, which were used as the future years for the small SI rule analyses. The model evaluation case uses prescribed burning and wildfire emissions specific to 2002, which were developed and modeled as day-specific, location-specific emissions using an updated version of Sparse Matrix Operator Kernel Emissions (SMOKE) system, version 2.3, which computes plume rise and vertically allocates the fire emissions. It also includes continuous emissions monitoring (CEM) data for 2002 for electric generating units (EGUs) with CEMs. The 2002 and projection year baselines include an average fire sector and temporally averaged emissions (i.e., no CEM data) for EGUs. Projections from 2002 were developed to account for the expected impact of national

[^3]regulations, consent decrees or settlements, known plant closures, and, for some sectors, activity growth. For 2030, stationary sources used 2020 projections (i.e., no activity growth between 2020 and 2030). The 2020 and 2030 control cases from the final Locomotive/Marine rulemaking were used as the future baselines for the small SI engine analyses.
2. Meteorological Input Data: The gridded meteorological input data for the entire year of 2002 were derived from simulations of the Pennsylvania State University / National Center for Atmospheric Research Mesoscale Model. This model, commonly referred to as MM5, is a limited-area, nonhydrostatic, terrain-following system that solves for the full set of physical and thermodynamic equations which govern atmospheric motions. ${ }^{14}$ Meteorological model input fields were prepared separately for each of the domains shown in Figure II-1. The MM5 simulations were run on the same map projection as CMAQ. The 36 km national domain was modeled using MM5 v.3.6.0 using land-surface modifications that were added in v3.6.3. The 12 km eastern U.S grid was modeled with MM5 v3.7.2. These two sets of meteorological inputs were developed by EPA. For the 12 km western U.S. domain, we utilized existing MM5 meteorological model data prepared by the Western Regional Air Partnership (WRAP). ${ }^{15}$

The three meteorological model runs used similar sets of physics options. All three simulations used the Pleim-Xiu planetary boundary layer and vertical diffusion scheme, the RRTM longwave radiation scheme, and the Reisner 1 microphysics scheme. The EPA simulations used the Kain-Fritsch 2 subgrid convection scheme while the WRAP simulation used the Betts-Miller scheme for subgrid convection. In the EPA simulations, analysis nudging was utilized above the boundary layer for temperature and water vapor, and in all locations for the wind components using relatively weak nudging coefficients. The WRAP runs employed similar four-dimensional data assimilation, but also included observational nudging of surface winds. All three sets of model runs were conducted in 5.5 day segments with 12 hours of overlap for spin-up purposes. All three domains contained 34 vertical layers with an approximately 38 m deep surface layer and a 100 millibar top. The MM5 and CMAQ vertical structures are shown in Table II-2 and do not vary by horizontal grid resolution.

[^4]Table II-2. Vertical layer structure for MM5 and CMAQ (heights are layer top).

| CMAQ Layers | MM5 Layers | Sigma P | Approximate Height (m) | Approximate Pressure (mb) |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1.000 | 0 | 1000 |
| 1 | 1 | 0.995 | 38 | 995 |
| 2 | 2 | 0.990 | 77 | 991 |
| 3 | 3 | 0.985 | 115 | 987 |

|  | 23 | 0.550 | 4,212 | 595 |
| 12 | 24 | 0.500 | 4,816 | 550 |
|  | 25 | 0.450 | 5,461 | 505 |
|  | 26 | 0.400 | 6,153 | 460 |
| 13 | 27 | 0.350 | 6,903 | 415 |
|  | 28 | 0.300 | 7,720 | 370 |
|  | 29 | 0.250 | 8,621 | 325 |
|  | 30 | 0.200 | 9,625 | 280 |
| 14 | 31 | 0.150 | 10,764 | 235 |
|  | 32 | 0.100 | 12,085 | 190 |
|  | 33 | 0.050 | 13,670 | 145 |
|  | 34 | 0.000 | 15,674 | 100 |

The meteorological outputs from all three MM5 sets were processed to create modelready inputs for CMAQ using the Meteorology-Chemistry Interface Processor (MCIP), version 3.1, to derive the specific inputs to CMAQ. ${ }^{16}$

Before initiating the air quality simulations, it is important to identify the biases and errors associated with the meteorological modeling inputs. The 2002 MM5 model performance evaluations used an approach which included a combination of qualitative and quantitative analyses to assess the adequacy of the MM5 simulated fields. The qualitative aspects involved comparisons of the model-estimated synoptic patterns against observed patterns from historical

[^5]weather chart archives. Qualitatively, the model fields closely matched the observed synoptic patterns, which is expected given the use of nudging. The operational evaluation included statistical comparisons of model/observed pairs (e.g., mean normalized bias, mean normalized error, index of agreement, root mean square errors, etc.) for multiple meteorological parameters. For this portion of the evaluation, four meteorological parameters were investigated: temperature, humidity, wind speed, and wind direction. The operational piece of the analyses focuses on surface parameters. The Atmospheric Model Evaluation Tool (AMET) was used to conduct the analyses as described in this report. ${ }^{17}$ The three individual MM5 evaluations are described elsewhere. ${ }^{18,19,20}$ It was ultimately determined that the bias and error values associated with all three sets of 2002 meteorological data were generally within the range of past meteorological modeling results that have been used for air quality applications. ${ }^{21}$
3. Initial and Boundary Conditions: The lateral boundary and initial species concentrations are provided by a three-dimensional global atmospheric chemistry model, the GEOS-CHEM model. ${ }^{22}$ The global GEOS-CHEM model simulates atmospheric chemical and physical processes driven by assimilated meteorological observations from the NASA's Goddard Earth Observing System (GEOS). This model was run for 2002 with a grid resolution of 2.0 degree x 2.5 degree (latitude-longitude) and 20 vertical layers. The predictions were used to provide one-way dynamic boundary conditions at three-hour intervals and an initial concentration field for the CMAQ simulations. More information about the GEOS-CHEM model and other air quality applications using this tool is available at the following address: http://www-as.harvard.edu/chemistry/trop/geos.

## E. CMAQ Base Case Model Performance Evaluation

An operational model performance evaluation for ozone and $\mathrm{PM}_{2.5}$ and its related speciated components was conducted using 2002 State/local monitoring sites data in order to estimate the ability of the CMAQ modeling system to replicate the base year concentrations for

[^6]the $12-\mathrm{km}$ eastern and western domains. In summary, model performance statistics were calculated for observed-predicted pairs of daily, monthly, seasonal, and annual concentrations. Statistics were generated for the following geographic groupings: the entire 12-km Eastern US domain (EUS), the entire $12-\mathrm{km}$ Western US domain (WUS), and five large subregions: Midwest, Northeast, Southeast, Central, and West U.S. ${ }^{23}$ The "acceptability" of model performance was judged by comparing our CMAQ 2002 performance results to the range of performance found in the 2001 CMAQ results used in the proposal, as well as recent regional ozone and $\mathrm{PM}_{2.5}$ model applications (e.g., Clean Air Interstate Rule, Final PM NAAQS Rule). ${ }^{24}$ These other modeling studies represent a wide range of modeling analyses which cover various models, model configurations, domains, years and/or episodes, chemical mechanisms, and aerosol modules.

There are various statistical metrics available and used by the scientific community for model performance evaluation. The principal evaluation statistics used to evaluate CMAQ performance were two bias metrics, normalized mean bias and fractional bias; and two error metrics, normalized mean error and fractional error. Normalized mean bias (NMB) is used as a normalization to facilitate a range of concentration magnitudes. This statistic averages the difference (model - observed) over the sum of observed values. NMB is a useful model performance indicator because it avoids over inflating the observed range of values, especially at low concentrations. Normalized mean bias is defined as:
$\mathrm{NMB}=\frac{\sum_{1}^{n}(P-O)}{\sum_{1}^{n}(O)} * 100$, where $\mathrm{P}=$ predicted concentrations and $\mathrm{O}=$ observed
Normalized mean error (NME) is also similar to NMB, where the performance statistic is used as a normalization of the mean error. NME calculates the absolute value of the difference (model observed) over the sum of observed values. Normalized mean error is defined as:

NME $=\frac{\sum_{1}^{n}|P-O|}{\sum_{1}^{n}(O)} * 100$, where $\mathrm{P}=$ predicted concentrations and $\mathrm{O}=$ observed

[^7]Fractional bias is defined as:
$\mathrm{FB}=\frac{1}{n}\left(\frac{\sum_{1}^{n}(P-O)}{\sum_{1}^{n}\left(\frac{(P+O)}{2}\right)}\right) * 100$, where $\mathrm{P}=$ predicted concentrations and $\mathrm{O}=$ observed
FB is a useful model performance indicator because it has the advantage of equally weighting positive and negative bias estimates. The single largest disadvantage in this estimate of model performance is that the estimated concentration (i.e., prediction, P ) is found in both the numerator and denominator.

Fractional error (FE) is similar to fractional bias except the absolute value of the difference is used so that the error is always positive. Fractional error is defined as:
$\mathrm{FE}=\frac{1}{n}\left(\frac{\sum_{1}^{n}|P-O|}{\sum_{1}^{n}\left(\frac{(P+O)}{2}\right)}\right) * 100$, where $\mathrm{P}=$ predicted concentrations and $\mathrm{O}=$ observed
Overall, the bias and error statistics shown in Table II-3 below indicate that the base case model ozone and $\mathrm{PM}_{2.5}$ concentrations are within the range or close to that found in recent EPA applications. The CMAQ model performance results give us confidence that our applications of CMAQ using this 2002 modeling platform provide a scientifically credible approach for assessing ozone and $\mathrm{PM}_{2.5}$ concentrations for the purposes of the final small SI engine rule. A detailed summary of the CMAQ model performance evaluation is available. ${ }^{25}$ A summary of the $\mathrm{PM}_{2.5}$ and ozone evaluation is presented here.

1. $P M_{2.5}$ : The $\mathrm{PM}_{2.5}$ evaluation focuses on $\mathrm{PM}_{2.5}$ total mass and its components including sulfate $\left(\mathrm{SO}_{4}\right)$, nitrate $\left(\mathrm{NO}_{3}\right)$, total nitrate $\left(\mathrm{TNO}_{3}=\mathrm{NO}_{3}+\mathrm{HNO}_{3}\right)$, ammonium $\left(\mathrm{NH}_{4}\right)$, elemental carbon (EC), and organic carbon (OC). The $\mathrm{PM}_{2.5}$ performance statistics were calculated for each month and season individually and for the entire year, as a whole. Seasons were defined as: winter (December-January-February), spring (March-April-May), summer (June-July-August), and fall (September-October-November). PM 2.5 ambient measurements for 2002 were obtained from the following networks for model evaluation: Speciation Trends Network (STN- 199 sites), Interagency Monitoring of PROtected Visual Environments (IMPROVE- 150 sites), and Clean Air Status and Trends Network (CASTNet- 83 sites). For brevity, Table II-3 provides annual model performance statistics for $\mathrm{PM}_{2.5}$ and its component species for the $12-\mathrm{km}$ Eastern domain, $12-\mathrm{km}$ Western domain, and five subregions defined above (Midwest, Northeast, Southeast, Central, and West U.S.).
[^8]Table II-3. Summary of 2002 CMAQ annual $\mathbf{P M}_{2.5}$ species model performance statistics.

| CMAQ 2002 Annual |  |  | No. of Obs. | NMB (\%) | NME (\%) | FB (\%) | FE (\%) |

2. Ozone: The ozone evaluation focuses on the observed and predicted hourly ozone concentrations and eight-hour daily maximum ozone concentrations using a observation threshold of 40 ppb (i.e., only data pairs in which the observed value was greater than or equal to 40 ppb were considered). This ozone model performance was limited to the period used in the calculation of projected design values within the analysis: May, June, July, August, and September. Ozone ambient measurements for 2002 were obtained from the Air Quality System (AQS) Aerometric Information Retrieval System (AIRS). A total of 1178 ozone measurement sites were included for evaluation. These ozone data were measured and reported on an hourly basis.

Table II-4 and II-5 provide hourly and eight-hour daily maximum ozone model performance statistics, respectively, for the $12-\mathrm{km}$ Eastern and Western U.S. domain and the five subregions. Generally, hourly and eight-hour ozone model performance are under-predicted in both the $12-\mathrm{km}$ EUS and WUS when applying a threshold of 40 ppb for the modeled ozone season (May-September). For the 12-km EUS and WUS domain, the bias and error statistics are comparable for the aggregate of the ozone season and for each individual ozone month modeled.

Table II-4. Summary of CMAQ 2002 hourly ozone model performance statistics

## F. CMAQ Small Spark-Ignition Engine Modeling Scenarios

The CMAQ modeling system was used to calculate annual $\mathrm{PM}_{2.5}$ concentrations, daily 8hour ozone concentrations, and visibility estimates for each of the following seven emissions scenarios:

1) 2002 base case
2) 2020 future baseline
3) 2020 future control case - small SI and marine SI controls
4) 2020 future control case - marine SI controls only
5) 2030 future baseline
6) 2030 future control case - small SI and marine SI controls
7) 2030 future control case - marine SI controls only

Appendix A identifies which source classification codes (SCCs) are part of the small SI subsector and which SCCs are part of the marine SI subsector.

Model predictions are used in a relative sense to estimate scenario-specific, future-year design values of $\mathrm{PM}_{2.5}$ and ozone. This is done by calculating the simulated air quality ratios between any particular future year simulation and the 2002 base. These predicted change ratios are then applied to ambient base year design values. The design value projection methodology used in this analysis followed EPA guidance for such analyses. ${ }^{26}$ We used the 5-year weighted average 2000-2004 design values as the starting point for the projections. Additionally, the raw model outputs are also used in a relative sense for creating inputs to the health and welfare impact functions of the benefits analysis.

## III. CMAQ Model Results

## A. Impacts of the Spark-Ignition Engine Rule on Future 8-Hour Ozone Levels

This section summarizes the results of our modeling of ozone air quality impacts in the future due to the reductions in small SI and marine SI emissions. Appendix B contains 8-hour ozone design values by county for each future-year modeling scenario. The modeling results indicate that the emissions reductions from this rule will contribute appreciably to lower ambient 8 -hour ozone design values in future years. Tables III-1 and III-2 show the projected improvements in average 8-hour ozone design values, for various years as a result of the four SI control scenarios.

[^9]Table III-1. Model-projected change in average 8-hour ozone design values resulting from the nonroad spark-ignition emissions reductions for several categories of counties. Units are ppb.

| Average change | $\mathbf{2 0 2 0}$ <br> marine SI <br> controls <br> only | 2020 <br> small and <br> marine SI <br> controls | 2030 <br> marine SI <br> controls <br> only | 2030 <br> small and <br> marine SI <br> controls |
| :---: | :---: | :---: | :---: | :---: |
| Average change in all counties | -0.21 | -0.47 | -0.36 | -0.66 |
| Average change in counties whose base year |  |  |  |  |
| design value is above the NAAQS | -0.28 | -0.62 | -0.47 | -0.88 |
| Average change in counties whose base year <br> design value is within 10\% of the NAAQS | -0.20 | -0.42 | -0.34 | -0.61 |
| Average change in counties whose projection year <br> design value is above the NAAQS | -0.05 | -0.13 | -0.03 | -0.10 |
| Average change in counties whose projection year <br> design value is within 10\% of the NAAQS | -0.38 | -0.71 | -0.64 | -1.05 |

Table III-2. Model-projected, population-weighted, change in average 8-hour ozone design values resulting from the nonroad spark-ignition emissions reductions for several categories of counties. Units are ppb.

| Average change | $\mathbf{2 0 2 0}$ <br> marine SI <br> controls <br> only | $\mathbf{2 0 2 0}$ <br> small and <br> marine SI <br> controls | $\mathbf{2 0 3 0}$ (arine SI <br> controls <br> only | $\mathbf{2 0 3 0}$ <br> small and <br> marine SI <br> controls |
| :---: | :---: | :---: | :---: | :---: |
| Average change in all counties | -0.23 | -0.57 | -0.36 | -0.76 |
| Average change in counties whose base year <br> design value is above the NAAQS | -0.25 | -0.61 | -0.38 | -0.80 |
| Averge change in counties whose base year <br> design value is within 10\% of the NAAQS | -0.24 | -0.55 | -0.41 | -0.78 |
| Average change in counties whose projection year <br> design value is above the NAAQS | -0.06 | -0.17 | -0.04 | -0.13 |
| Average change in counties whose projection year <br> design value is within 10\% of the NAAQS | -0.25 | -0.54 | -0.43 | -0.79 |

The modeling projects that eight counties will have design values greater than 0.08 ppm in 2020 and 6 counties will exceed that level in 2030. Based on this modeling, over 22 million people are projected to live in an ozone nonattainment county in 2020. While the controls from the SI engine rule are not enough to bring any of these counties into attainment by 2020 or 2030, they do result in lower baseline design values that will make it easier to attain the ozone standard.

As can be seen from Table III-1, the final spark-ignition engine controls will lower ozone design values on average by 0.47 ppb in 2020 and by 0.66 ppb in 2030. Unlike past EPA rules controlling NOx emissions, there are no instances in which the final nonroad SI engine rule controls are projected to increase ozone levels. The largest decrease in a county-level 8-hour ozone design values occurs in the Boston area (Barnstable Co.) where the rule is projected to result in a decrease of 2.0 ppb in 2020 and 3.2 ppb in 2030. The modeling also indicated that both the small SI and marine SI components of the rule improved air quality relatively equally.

Figures III-1 through III-4 display the projected county-level, 8-hour ozone design value changes expected from the final nonroad SI engine control scenarios. The largest impacts tend to be in areas near water, where marine SI source contributions can be large.

Figure III-1. Model-projected change in annual 8-hour ozone design values from the small SI and marine SI control scenario in 2020. Units are ppb.

Figure III-2. Model-projected change in annual 8-hour ozone design values from the marine SI control scenario in $\mathbf{2 0 2 0}$. Units are ppb.

Figure III-3. Model-projected change in annual 8-hour ozone design values from the small SI and marine SI control scenario in 2030. Units are ppb.

Figure III-4. Model-projected change in annual 8-hour ozone design values from the marine SI control scenario in 2030. Units are ppb.

## B. Impacts of the Spark-Ignition Engine Rule on Future $\mathbf{P M}_{2.5}$ Annual Averages

This section summarizes the results of our modeling of $\mathrm{PM}_{2.5}$ air quality impacts in the future due to the reductions in small SI and marine SI emissions. Appendix C contains annual average $\mathrm{PM}_{2.5}$ design values by county for each future modeling scenario. The modeling results indicate that the emissions reductions from this rule will contribute to lower ambient $\mathrm{PM}_{2.5}$ levels in future years. Tables III-3 and III-4 show the projected improvements in average annual $\mathrm{PM}_{2.5}$ design values, for various years as a result of the nonroad SI control scenarios discussed in Section II.F.

Table III-3. Model-projected change in annual average $\mathbf{P M}_{2.5}$ design values resulting from the nonroad spark-ignition emissions reductions for several categories of counties. Units are $\mu \mathrm{g} / \mathrm{m}^{3}$.

| Average change | $\mathbf{2 0 2 0}$ <br> marine SI <br> controls <br> only | $\mathbf{2 0 2 0}$ <br> small and <br> marine SI <br> controls | $\mathbf{2 0 3 0}$ marine SI <br> controls <br> only | $\mathbf{2 0 3 0}$ <br> small and <br> marine SI <br> controls |
| :---: | :---: | :---: | :---: | :---: |
| Average change in all counties | -0.01 | -0.02 | -0.01 | -0.02 |
| Average change in counties whose base year <br> design value is above the NAAQS | -0.01 | -0.02 | -0.01 | -0.02 |
| Average change in counties whose base year <br> design value is within 10\% of the NAAQS | -0.01 | -0.02 | -0.01 | -0.02 |
| Average change in counties whose projection year <br> design value is above the NAAQS | -0.00 | -0.01 | -0.00 | -0.01 |
| Average change in counties whose projection year <br> design value is within 10\% of the NAAQS | -0.01 | -0.02 | -0.01 | -0.03 |

Table III-4. Model-projected, population-weighted, change in annual average $\mathbf{P M}_{2.5}$ design values resulting from the nonroad spark-ignition emissions reductions for several categories of counties. Units are $\mu \mathrm{g} / \mathrm{m}^{3}$.

| Average change | $\mathbf{2 0 2 0}$ <br> marine SI <br> controls <br> only | $\mathbf{2 0 2 0}$ <br> small and <br> marine SI <br> controls | $\mathbf{2 0 3 0}$ <br> marine SI <br> controls <br> only | $\mathbf{2 0 3 0}$ <br> small and <br> marine SI <br> controls |
| :---: | :---: | :---: | :---: | :---: |
| Average change in all counties | -0.01 | -0.02 | -0.01 | -0.02 |
| Average change in counties whose base year <br> design value is above the NAAQS | -0.01 | -0.02 | -0.01 | -0.02 |
| Average change in counties whose base year <br> design value is within 10\% of the NAAQS | -0.01 | -0.02 | -0.01 | -0.03 |
| Average change in counties whose projection year <br> design value is above the NAAQS | -0.00 | -0.01 | -0.00 | -0.01 |
| Average change in counties whose projection year <br> design value is within $10 \%$ of the NAAQS | -0.01 | -0.03 | -0.02 | -0.03 |

The modeling projects that 11 counties will have design values greater than $15.0 \mu \mathrm{~g} / \mathrm{m}^{3}$ in 2020 and 10 counties will exceed that threshold in 2030. Over 24 million people are projected to live in a $\mathrm{PM}_{2.5}$ nonattainment county in the future. The small SI and marine SI controls are not enough to bring any of these counties into attainment in the future, but they do result in small improvements in $\mathrm{PM}_{2.5}$ concentrations. As can be seen from Table III-3, the final SI engine rule controls will lower $\mathrm{PM}_{2.5}$ concentrations on average by $0.01 \mu \mathrm{~g} / \mathrm{m}^{3}$ in 2020 and $0.02 \mu \mathrm{~g} / \mathrm{m}^{3}$ in 2030. These improvements in $\mathrm{PM}_{2.5}$ air quality are also projected in areas where present-day and future-projected $\mathrm{PM}_{2.5}$ levels are above or near the NAAQS. For instance, when considering only those counties whose future year design values are projected to exceed the NAAQS, the average improvement resulting from this rule is $0.01 \mu \mathrm{~g} / \mathrm{m}^{3}$ in 2020 and $0.02 \mu \mathrm{~g} / \mathrm{m}^{3}$ in 2030. Additionally, as shown in Table III-4, the improvements resulting from the rule are larger when population-weighted. The greatest impacts from the final nonroad SI engine rule emissions reductions tend to occur in areas with high populations. The largest reduction in annual average $\mathrm{PM}_{2.5}$ occurs in Lake County IL (northern Chicago suburbs) where the rule is projected to result in a $0.06 \mu \mathrm{~g} / \mathrm{m}^{3}$ improvement in 2020 and $0.08 \mu \mathrm{~g} / \mathrm{m}^{3}$ in 2030. The largest reduction in an area that is projected to exceed the $\mathrm{PM}_{2.5}$ NAAQS in 2020 and 2030 is in the Pittsburgh region (Allegheny Co.) where the annual average $\mathrm{PM}_{2.5}$ design value is projected to drop from 16.04 to $16.01 \mu \mathrm{~g} / \mathrm{m}^{3}$ in 2020 , and 15.99 to $15.95 \mu \mathrm{~g} / \mathrm{m}^{3}$ in 2030 as a result of the final nonroad SI engine rule. The modeling indicated that both the small SI and marine SI components of the rule improved $\mathrm{PM}_{2.5}$ air quality relatively equally, although slightly more improvement was attributable to the marine portion of the rule.

Figures III-5 through III-8 display the projected county-level, annual $\mathrm{PM}_{2.5}$ design value changes expected from various SI control scenarios and years associated with this rule. The largest impacts tend to be in areas near water, where marine source contributions (i.e., from pleasure craft) can be large.

Figure III-5. Model-projected change in annual PM $_{2.5}$ design values from the small SI and marine SI control scenario in 2020 . Units are $\mu \mathrm{g} / \mathrm{m}^{3}$.

Figure III-6. Model-projected change in annual $\mathrm{PM}_{2.5}$ design values from the marine SI control scenario in 2020 . Units are $\mu \mathrm{g} / \mathrm{m}^{3}$.

Figure III-7. Model-projected change in annual PM $_{2.5}$ design values from the small SI and marine SI control scenario in 2030. Units are $\mu \mathrm{g} / \mathrm{m}^{3}$.

Figure III-8. Model-projected change in annual PM $_{2.5}$ design values from the marine SI control scenario in 2030 . Units are $\mu \mathrm{g} / \mathrm{m}^{3}$.

## C. Impacts of the Small Spark-Ignition Engine Rule on Visibility

The modeling conducted for the small SI and marine SI engine rule was also used to project the impacts of the reductions on visibility conditions over 133 mandatory class I federal areas across the U.S. in 2020 and 2030. The results indicate that reductions in regional haze would occur in all 133 of these federal areas as a result of the rule. The model projects that average visibility on the $20 \%$ worst days would improve by 0.01 deciviews in 2020 and 0.02 deciviews in 2030. ${ }^{27}$ The greatest visibility improvement due to this rule would occur at the Brigantine Wilderness area in New Jersey where a 0.14 deciview improvement is projected by 2030 as a result of the spark-ignition engine controls in this rule. Appendix D contains the visibility projections from the final nonroad SI engine rule over 133 Class 1 areas.

[^10]
## Appendix A: Source Classification Codes (SCCs) that comprise the Small SI and Marine SI sectors.

| SCC | Subsector | SCC Descriptor |
| :---: | :---: | :---: |
| 2282005010 | Marine SI | Mobile Sources: Pleasure Craft: Gasoline 2-Stroke: Outboard |
| 2282005015 | Marine SI | Mobile Sources: Pleasure Craft: Gasoline 2-Stroke: Personal Water Craft |
| 2282010005 | Marine SI | Mobile Sources: Pleasure Craft: Gasoline 4-Stroke: Inboard/Sterndrive |
| 2260001060 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Recreational Equipment: Specialty Vehicles/Carts |
| 2260002006 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Construction and Mining Equipment: Tampers/Rammers |
| 2260002009 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Construction and Mining Equipment: Plate Compactors |
| 2260002021 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Construction and Mining Equipment: Paving Equipment |
| 2260002027 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Construction and Mining Equipment: Signal Boards/Light Plants |
| 2260002039 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Construction and Mining Equipment: Concrete/Industrial Saws |
| 2260002054 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Construction and Mining Equipment: Crushing/Processing Equipment |
| 2260003030 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Industrial Equipment: Sweepers/Scrubbers |
| 2260003040 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Industrial Equipment: Other General Industrial Equipment |
| 2260004015 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Rotary Tillers $<6 \mathrm{HP}$ (Residential) |
| 2260004016 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Rotary Tillers $<6 \mathrm{HP}$ (Commercial) |
| 2260004020 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Chain Saws < 6 HP (Residential) |
| 2260004021 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Chain Saws 6 HP (Commercial) |
| 2260004025 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Trimmers/Edgers/Brush Cutters (Residential) |
| 2260004026 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Trimmers/Edgers/Brush Cutters (Commercial) |
| 2260004030 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Leafblowers/Vacuums (Residential) |
| 2260004031 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Leafblowers/Vacuums (Commercial) |
| 2260004035 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Snowblowers (Residential) |
| 2260004036 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Snowblowers (Commercial) |
| 2260004071 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Lawn and Garden Equipment: Turf Equipment (Commercial) |
| 2260005035 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Agricultural Equipment: Sprayers |
| 2260005050 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Agricultural Equipment: Hydro-power Units |
| 2260006005 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Commercial Equipment: Generator Sets |
| 2260006010 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Commercial Equipment: Pumps |
| 2260006015 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Commercial Equipment: Air Compressors |
| 2260007005 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 2-Stroke: Logging Equipment: Chain Saws > 6 HP |
| 2265001050 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Recreational Equipment: Golf Carts |
| 2265001060 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Recreational Equipment: Specialty Vehicles/Carts |
| 2265002003 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Pavers |
| 2265002006 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Tampers/Rammers |
| 2265002009 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Plate Compactors |

| 2265002015 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Rollers |
| :---: | :---: | :---: |
| 2265002021 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Paving Equipment |
| 2265002024 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Surfacing Equipment |
| 2265002027 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Signal Boards/Light Plants |
| 2265002030 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Trenchers |
| 2265002033 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Bore/Drill Rigs |
| 2265002039 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Concrete/Industrial Saws |
| 2265002042 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Cement and Mortar Mixers |
| 2265002054 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Crushing/Processing Equipment |
| 2265002066 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Tractors/Loaders/Backhoes |
| 2265002072 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Skid Steer Loaders |
| 2265002078 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Construction and Mining Equipment: Dumpers/Tenders |
| 2265003030 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Industrial Equipment: Sweepers/Scrubbers |
| 2265003040 | Small SI | Mobile Sources: Off-highway Vehicle Gasoline, 4-Stroke: Industrial Equipment: Other General Industrial Equipment |

    ${ }^{2}$ U.S. Environmental Protection Agency; Technical Support Document for the Proposed Small Spark Ignition (SI) and Marine SI Emissions Standards: Ozone Air Quality Modeling; Office of Air Quality Planning and Standards; EPA-454 / R-07-006, Research Triangle Park, NC; April 2007; 18 pp.
    ${ }^{3}$ Byun, D.W., and K. L. Schere, 2006: Review of the Governing Equations, Computational Algorithms, and Other Components of the Models-3 Community Multiscale Air Quality (CMAQ) Modeling System. Applied Mechanics Reviews, Volume 59, Number 2 (March 2006), pp. 51-77.
    ${ }^{4}$ U.S. Environmental Protection Agency; Technical Support Document for the Final Locomotive/Marine Rule: Air Quality Modeling Analyses; Office of Air Quality Planning and Standards; EPA-454 / R-08-002; Research Triangle Park, NC; January 2008; 63 pp.
    ${ }^{5}$ CMAQ version 4.6 was released on September 30, 2006. It is available from the Community Modeling and Analysis System (CMAS) at: http://www.cmascenter.org .

[^1]:    ${ }^{6}$ The document is available from http://www.regulations.gov with the document identification number: EPA-HQ-OAR-2003-0190-0866.

[^2]:    ${ }^{7}$ We also modeled 10 days at the end of December 2001 as a modeled "ramp up" period. These days are used to minimize the effects of initial conditions and are not considered as part of the output analyses.

[^3]:    ${ }^{8}$ Technical Support Document: Preparation of Emissions Inventories for the 2002-based Platform, Version 3.0, Criteria Air Pollutants, January 2008. The document is available from http://www.regulations.gov with the document identification number: EPA-HQ-OAR-2003-0190-0850.
    ${ }^{9}$ The California Air Resources Board submitted annual emissions for California. These were allocated to monthly resolution prior to emissions modeling using data from the National Mobile Inventory Model (NMIM).
    ${ }^{10}$ MOBILE6 version was used in the Mobile Source Air Toxics Rule: Regulatory Impact Analysis for Final Rule: Control of Hazardous Air Pollutants from Mobile Sources, U.S. Environmental Protection Agency, Office of Transportation and Air Quality, Assessment and Standards Division, Ann Arbor, MI 48105, EPA420-R-07-002, February 2007.
    ${ }^{11}$ NONROAD2005 version was used in the proposed rule for small spark ignition (SI) and marine SI rule: Draft Regulatory Impact Analysis: Control of Emissions from Marine SI and Small SI Engines, Vessels, and Equipment , U.S. Environmental Protection Agency, Office of Transportation and Air Quality, Office of Transportation and Air Quality, Assessment and Standards Division, Ann Arbor, MI, EPA420-D-07-004, April 2007.
    ${ }^{12}$ U.S. Environmental Protection Agency, Draft Regulatory Impact Analysis: Control of Emissions of Air Pollution from Locomotive Engines and Marine Compression-Ignition Engines Less than 30 Liters per Cylinder, EPA420-D-07-001, January 2007.

[^10]:    ${ }^{27}$ The level of visibility impairment in an area is based on the light-extinction coefficient and a unit less visibility index, called a "deciview", which is used in the valuation of visibility. The deciview metric provides a scale for perceived visual changes over the entire range of conditions, from clear to hazy. Under many scenic conditions, the average person can generally perceive a change of one deciview. The higher the deciview value, the worse the visibility. Thus, an improvement in visibility is a decrease in deciview value.
